Press Release

AQUANAUTS GRENADA NOW ENRICHED AIR NITROX FACILITY

With its newest hardware, a Nitrox Auto Blender, Aquanauts Grenada now is able to supply Enriched Air Nitrox to its customers.

Grenada, March 1, 2003: **Aquanauts Grenada proudly announces the arrival and installation of its newest equipment - a Nitrox auto blender. The Nitrox Auto Blender is designed to mix Oxygen with ambient air to create Nitrox mixes containing from 21 % to 40% Oxygen. The operator enters the desired Oxygen percentage in the computer and the computer controls the entire mixing process continuously. Two oxygen analyzers ensure safety and correct mix. There are safe guards built into the auto blender to prevent greater than 40% oxygen content mixes entering the compressor and to halt the oxygen flow immediately should the compressor stop.**

This new system allows Aquanauts Grenada to provide its customers with Nitrox mixes for repetitive diving. Nitrox mixes allows divers to extend their bottom times at wrecks like the Bianca C, San Juan and King Mitch. In conjunction with the recent introduction of technical dive courses through SDI/TDI at Aquanauts, this new installation opens a whole new world for Aquanauts Grenada's customers and students.
